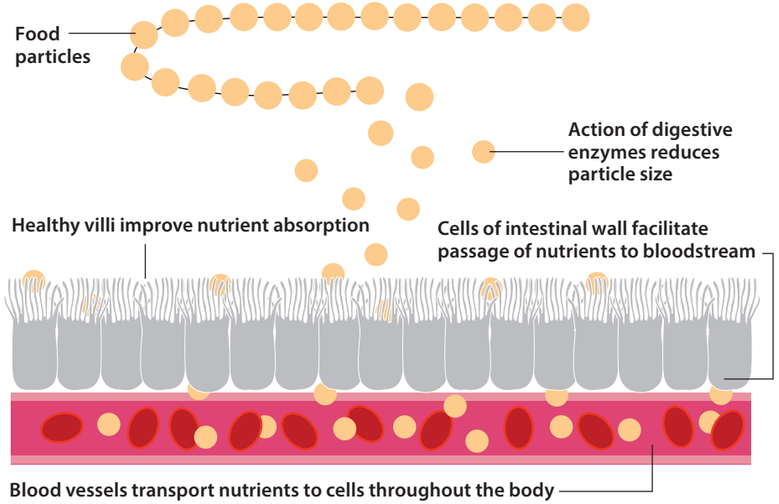
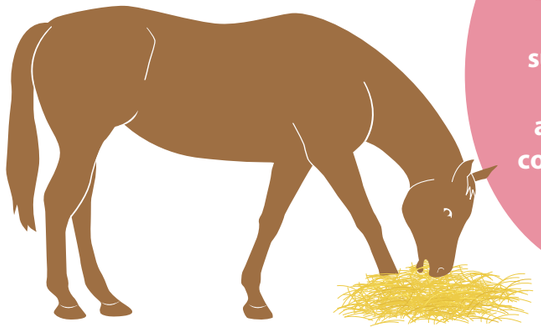
Don't let poor digestive tract health sideline your horse.

Horses with a healthy GI tract digest their feed more effectively so they absorb additional nutrients. They are less likely to suffer from digestive imbalances resulting in colic, diarrhea and ulcers.



Providing horses with ample opportunity to graze or offering free-choice hay is one of the best ways to keep their digestive tract healthy.



An unhealthy digestive tract can lead to subtle changes such as sour attitude, poor coat quality, and weight loss.

Certain horses are at greater risk for developing digestive imbalances that lead to colic, diarrhea and ulcers.

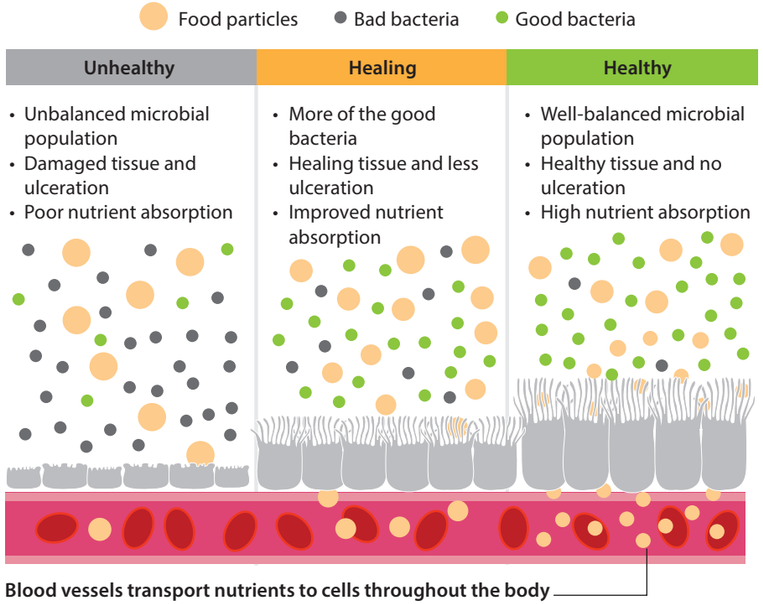
Horses with a busy lifestyle where grazing is limited and stress levels are high
- Performance or racehorses
- Young horses in training
- Horses that travel

Horses with certain dispositions
- High-strung/excitable
- Timid and easily stressed
- Overly aggressive
- Quiet worrier
- Herd-bound

Horses with a past history
- Prone to sour attitude and indigestion
- Treated for gastric or colonic ulcers in the past
- Recent or ongoing treatment with NSAIDs and/or antibiotics

Limited grazing, inadequate amounts of fiber, larger grain meals, and frequent routine changes can irritate gastrointestinal tissues and disrupt the sensitive microbial populations that are so important to your horse's digestive health.

Absorption of food in digestive tract



Neigh-Lox® Advanced

Neigh-Lox Advanced provides a scientifically advanced blend of ingredients that work synergistically to maintain your horse's digestive tract in peak condition.

Fed daily, Neigh-Lox® Advanced supports a healthy equine GI tract, which reduces the incidence of:

- Colonic irritation and ulcers
- Colic and laminitis related to hindgut acidosis
- Diarrhea
- Gastric ulcers
- Low immunity
- Oxidative stress and cell membrane damage
