EndurExtra®

Does your horse need...

- Extra calories to maintain body condition
- Glowing hair coat to stand out in the crowd
- More energy to reduce fatigue
- Robust immune system in times of stress
- Stronger muscles for optimum performance

If so, check out EndurExtra®. It isn't your average fat supplement.

For Performance Horses

EndurExtra's unique combination of ingredients reduces fatigue and helps horses recover faster from competitions and races.

- Calories from fat deliver 2.25 times the amount of energy as carbohydrates and proteins, so you can feed less to maintain optimal performance
- Concentrated formula allows you to feed as little as 8 oz per day, reducing the risk of grain overload
- Fats are "cool" energy sources; they keep horses calm and focused on their work
- Flax and rice bran provide fatty acids essential for healthy skin and hair coat
- High-fat diets result in lower heart rates and less accumulation of lactic acid during work so your horse recovers faster
- 1000 IU of natural vitamin E per 8 oz serving provides beneficial antioxidants that support healthy muscles and a robust immune system
- Yeast cultures and direct-fed microbials support a healthy digestive tract and stimulate the appetite.

For Yearlings and Young Horses in Training

EndurExtra protects against carbohydrate overload while supplying the energy, essential fatty acids, gut conditioners, and antioxidants so horses meet their potential.

- Increases muscle mass
- Low starch levels support normal growth and maintain healthy muscle function
- Promotes healthy skin and a gleaming hair coat
- Provides calories while reducing the risk of grain overload
- Stimulates the appetite and maintains digestive health under stressful conditions
- Supplies natural vitamin E missing from hay, which protects muscles and boosts the immune system

For Broodmares

EndurExtra provides additional calories and antioxidants that help mares conceive and raise vigorous foals.

- Additional calories support milk production and help maintain optimal weight during lactation so foals grow better and conception rates increase
- Maintains weight on old or hard-to-keep mares without grain overload
- 1000 IU of natural vitamin E per serving supports beneficial antioxidant levels and a robust immune system in both mares and foals

For Older Horses

EndurExtra provides the additional calories, conditioners, and immune support seniors need to thrive.

- Additional natural vitamin E supports a healthy immune system
- High-fat, low-starch diets combat metabolic disease
- Pound for pound fat provides more calories than other feeds to maintain weight in older horses while decreasing the risk of grain overload
- Yeast cultures and direct-fed microbials support normal digestive tract function, reducing the risk of colic and laminitis

Ingredients with purpose

Fats

- EndurExtra is 50% fat. This unique blend of fats includes Equi-Jewel® stabilized rice bran, soy bean oil, and flax. The caloric density of these ingredients makes EndurExtra an incredible source of energy for intensely worked performance horses, mares in late gestation and early lactation, aged horses, and growing horses.

Because fats contain 2.25 times the energy of carbohydrates, supplementation with EndurExtra can reduce the amount of grain fed to horses. By decreasing meal size, horses are less prone to colic, laminitis, and insulin resistance-related disorders. High-grain diets are known to exacerbate some muscular problems, such as recurrent exertional rhabdomyolysis (RER), a form of tying-up. Research has proven that reducing the amount of grain fed to horses with RER and replacing those lost calories with a fat-rich supplement such as EndurExtra is essential in managing these syndromes.

Lecithin is a phospholipid composed of saturated, unsaturated, and polyunsaturated fatty acids. Lecithin also contains choline, a factor necessary in the production of acetyl-choline. As a neurotransmitter, acetylcholine is a critical component of the nervous system. Lecithin aids digestion, encouraging maximal absorption of nutrients.

Gut Conditioners

- Direct-fed microbials produce a hindgut environment that encourages the growth of beneficial bacteria. When these bacteria flourish, fiber digestion improves and horses can digest forages more efficiently and derive more energy from them. EndurExtra contains a proprietary yeast blend that includes *Saccharomyces cerevisiae* and *Aspergillus niger*, among other organisms. *Lactobacillus acidophilus* and *Enterococcus faecium* are two lactic acid-producing bacteria found in EndurExtra. Recent research indicates that lactic acid-producing bacteria may boost immunity in horses of all ages.

Antioxidants

- Natural vitamin E (d-alpha tocopherol) is a well-known antioxidant that prevents the oxidation of unsaturated lipids in cellular and subcellular membranes by neutralizing production of free radicals. This nutrient is important in all horses but especially in horses engaged in demanding exercise. Vitamin E can be obtained from natural or synthetic sources, and the source of the vitamin E can significantly influence vitamin E status in exercising horses. In several research trials, natural vitamin E was more effective in elevating plasma levels of tocopherol than synthetic vitamin E. Equine athletes supplemented with natural vitamin E often have greater tolerance to exercise, less oxidative stress to muscles, and a shorter recovery following intense exercise.
