

Electrolyte Use in Fall and Winter

Electrolyte supplementation in colder months depends on how much a horse is being ridden and how well they are drinking.

Electrolyte Supplementation

Horses that are ridden lightly a few times a week and drink well probably get sufficient electrolytes from hay, concentrate and salt block.

These horses probably DON'T NEED supplementation:

Horses no longer in work

Horses hacked once or twice a week

Horses in light training

Horses that continue to drink an average of 10 gallons of water a day in colder weather

Horses that train hard and sweat daily may require a well-formulated electrolyte supplement even in colder months.

These horses probably DO NEED supplementation:

Horses that remain in hard work

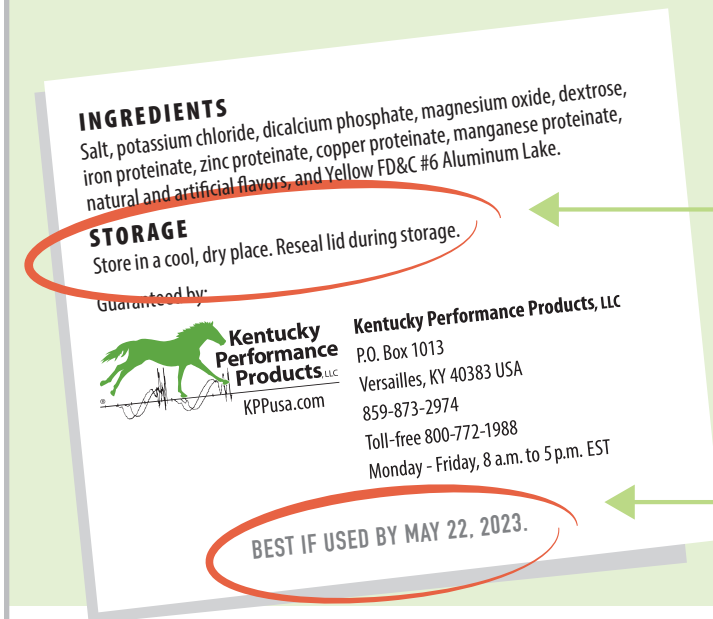

Horses that don't drink enough water when the temperature drops

Horses that sweat regularly

Horses in warmer climates

Ensure the electrolyte is still useable when spring returns.

1. Read storage recommendations and follow them closely.
2. Check the expiration/best buy date.

Summer Games® Electrolyte

- Replenishes critical electrolytes in the proper ratios.
- Supports drinking and maintains hydration.
