

Help your horse stay warm in winter

Horses begin to struggle to keep warm below certain critical temperatures.

Clipped Horse
critical temperature is
41°F (5°C)

Horse With a Thick Winter Coat
critical temperature is
18°F (-8°C)

WINDY

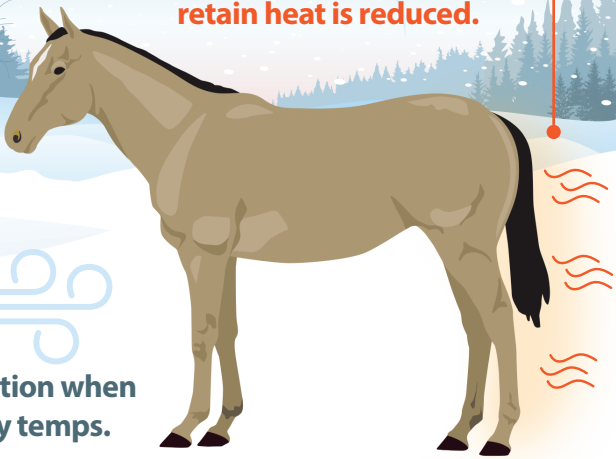

When horses are housed outside, exposure to wind can dramatically lower the ambient temperature.

Hair coat's ability to retain heat is reduced.

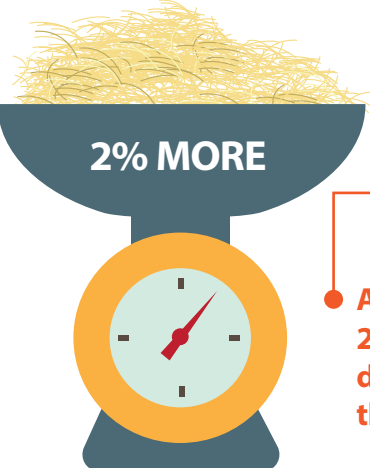

Be sure to take wind chill into consideration when looking at daily temps.

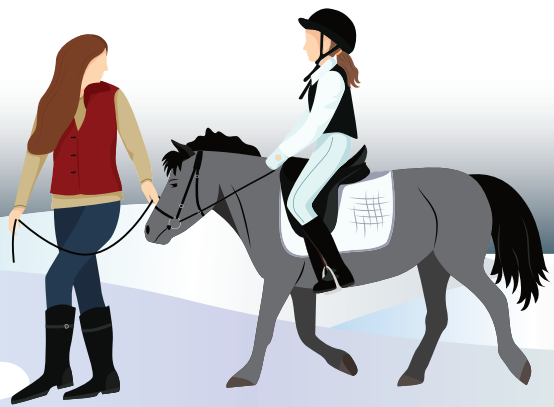

The easiest and most effective way to keep your horse warm when the temperatures drop is to feed additional forage.

2% MORE

A sedentary mature horse will need 2% more high-quality forage for every degree the temperature falls below the lower critical temperature.

Small or older horses will be less tolerant of cold temperatures.

Horses that are properly blanketed will stay warmer at lower temperatures.

Begin feeding additional hay 24 hours before cold temperatures are expected.

WEATHER FORECAST

SATURDAY	 Clear and sunny	65
24 SUNDAY	 75% storms	57
MONDAY	 Snow storms	25
TUESDAY	 Light snow	28

Neigh-Lox® Advanced

Neigh-Lox Advanced maintains a healthy digestive tract during seasonal changes and throughout stressful winter months. Begin supplementation 30 days prior to seasonal change.
