

## Is diarrhea a problem? When and how to use ProbioticWise™

Whether you are dealing with an acute situation or a chronic problem, diarrhea in horses is troubling at best and, at worst, life-threatening. As a practitioner, your goal is to find and treat the root of the problem and then restore normal gut function as soon as possible. ProbioticWise can help.

ProbioticWise is a unique, super concentrated source of both prebiotics and probiotics, including *Saccharomyces boulardii* and fermentation metabolites. ProbioticWise helps to restore normal gut function by influencing the gastrointestinal tissues on multiple levels. Its broad spectrum support sustains both the horse itself, and the microbial population that resides in the horse's gut.

### The key components in ProbioticWise:

- Contribute to a robust immune system
- Maintain a healthy population of beneficial bacteria throughout the GI tract by both supporting beneficial bacteria and flushing out pathogenic invaders
- Support the restoration of normal GI tract function in horses challenged by diarrhea (when the GI tract is functioning normally, diarrhea can be reduced or eliminated)
- Support complete digestion of starch and sugar in the foregut, lowering the risk of hindgut upset and pH imbalances (acidosis) that can lead to colic and laminitis
- Support reduced inflammation levels in GI tract tissues
- Supply nutrients to the gastrointestinal tissues that support the healing of stomach and colonic ulceration
- Supply polyphenols, nucleotides, and polysterols—antioxidants that contribute to the maintenance of healthy intestinal cell membrane function

### When to use ProbioticWise

ProbioticWise is recommended when horses of any age are challenged by acute or chronic diarrhea, foal scours, colonic or gastric ulcers, or other illnesses that stress a horse and disrupt the digestive tract. Preventative administration is indicated for horses that are at increased

risk for developing digestive imbalances, such as performance horses, racehorses, horses that are traveling, or those relocating to a new area.

### How to use ProbioticWise

In adult horses, for daily maintenance or preventative administration, feed 1 scoop (1 oz) per day. To support horses during competition, training or shipping: 2 scoops (2 oz) per day. To support restoration of normal gut function during acute or chronic episodes of diarrhea, offer 3 to 4 scoops (3 to 4 oz) daily for 3 to 5 days and then reduce to 2 scoops (2 oz) thereafter. In some instances higher levels for short-term use may be indicated. Do not exceed 6 scoops (6 oz) per day.

In foals, to support restoration of normal gut function, offer 30cc daily for 3 to 5 days and then reduce to 15cc thereafter. Do not exceed 30cc per day. To maintain digestive tract health in newborn foals, administer 15cc daily from 1 through 10 days of age.

ProbioticWise is available in both a powdered form and a paste. The powder is available in a 2.5 or 9.5 lb bucket. The paste is dispensed in a 60cc dosing syringe that contains 4 servings per tube. ProbioticWise is readily available through your veterinary supply distributor.
